

Reflections on Technological Progress in the Agri-Food Industry: Then, Now & Tomorrow

Getu Hailu,

Professor Department of Food, Agricultural and Resource Economics

President's Address

**CANADIAN AGRICULTURAL ECONOMICS SOCIETY,
AUGUST 9-11, 2022 ANNUAL MEETING**

Society

The primary mission of profession or academic societies is mainly educational and idea/knowledge exchange/sharing through:

Publishing peer-reviewed research journal articles

Developing professional excellence (create opportunities for graduate students)

Raising public awareness

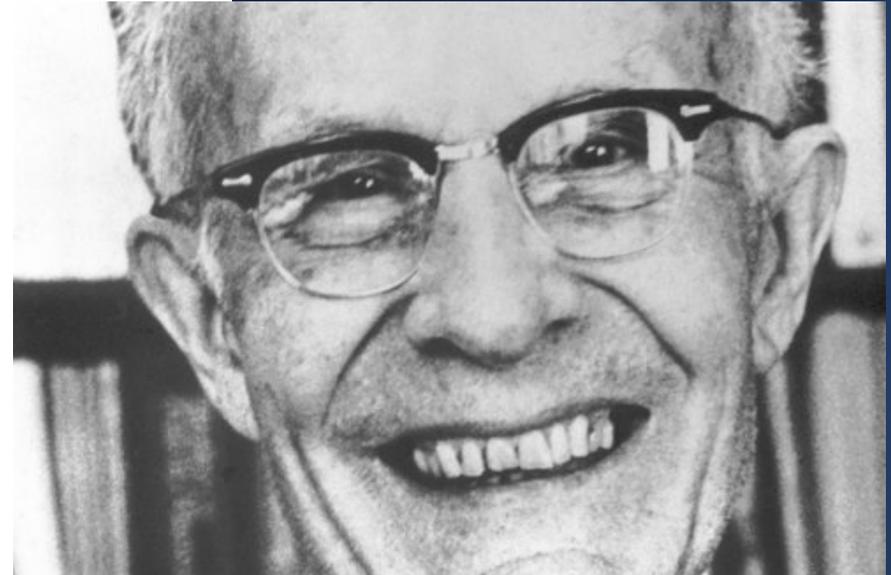

To make awards.

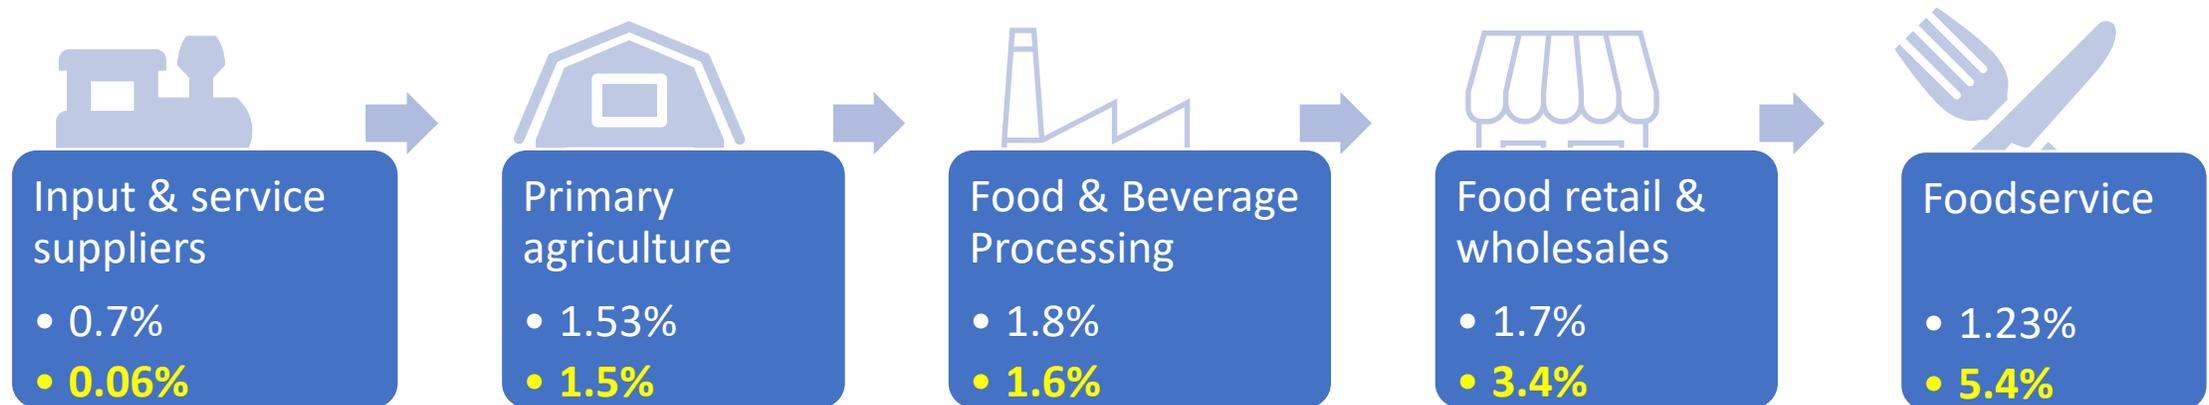

Advances knowledge and policy discussion in food, agricultural & resource economics.

“Efficient but poor” hypothesis

- Low-income levels in developing country agriculture are a result of the **low productivity** of the available factors of production, **not of inefficiencies in their allocation**.
- The implications of this thesis are:
 - A reallocation of the available factors of production could not help farmers improve productivity (through, for example, extension).
 - **Shift in the frontier:**
 - Importance of **investment in education** to facilitate the **diffusion of new factors** (innovation) that could enhance productivity.
- **Getu Hailu**, Vera, B., Belay Kassa and Strock, H. (1998). Technical Efficiency of Smallholder Annual Crop Production in Moisture Stress Area of Eastern Oromiya of Ethiopia: a Stochastic Frontier Analysis, *Ethiopian Journal of Agricultural Economics*, 2(2):19–115.

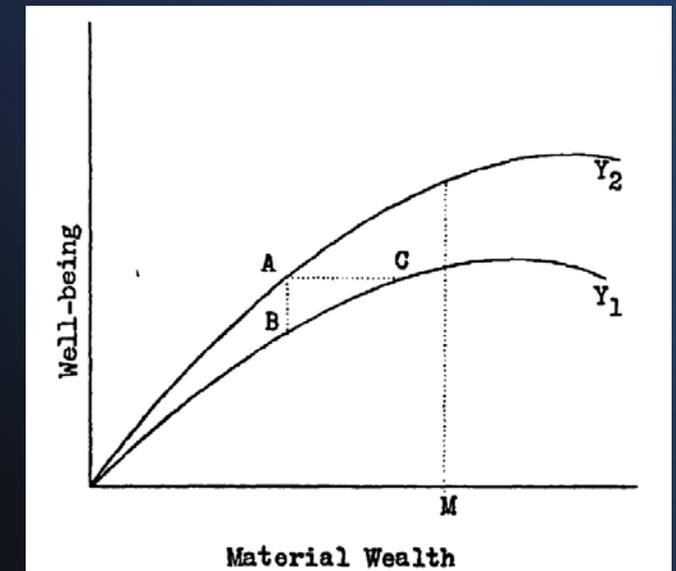

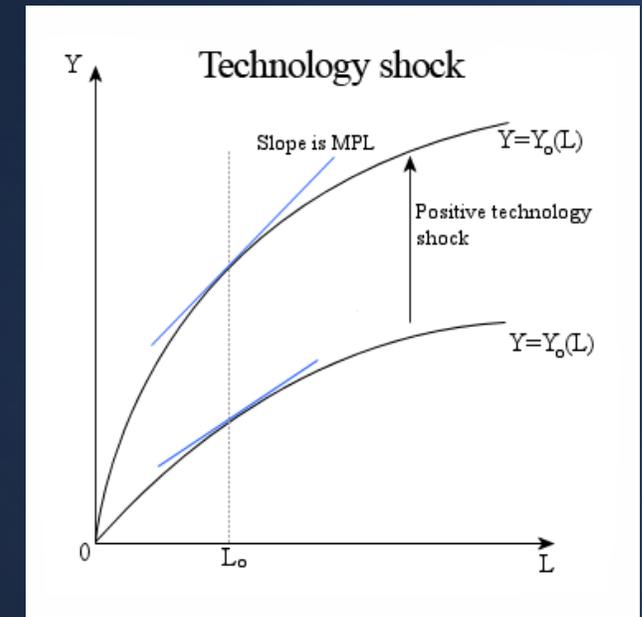

Canada's Agri-Food Industry (2021)

- GDP = \$127.3 bn (6.3%)
- Jobs = 2,258,185 (11.9%)

Technological Progress

- Our desire for more satisfaction (utility) gives rise to two **interdependent issues** that we must face:
 - 1) **how to increase the value of the scarce resource (efficiency)**, and
 - 2) **how to allocate the increment in wealth (equity)**.
- Innovation refers to doing something that has not been done before.
 - the development of a new method of production
 - the introduction of new goods/service
 - the opening of a new market
 - the discovery of a new source of supply
 - changes in the rules of the game (institutions, organizations)
- Innovation opportunity sets for society.
- Most innovations that affect the economy are **technological (scientific)** innovations.
- **Technology** embodies the **prevailing knowledge**.
- The growth of knowledge then creates new *technological possibilities* – **technological progress**.

Technological Progress, Productivity

- **Technological progress** = the discovery of new and improved methods of producing goods.
 - main driver of an increase in the **productivity** of factors of production (labour, capital).
- **Changes in TFP**= changes in output that can't be explained changes in factors of production

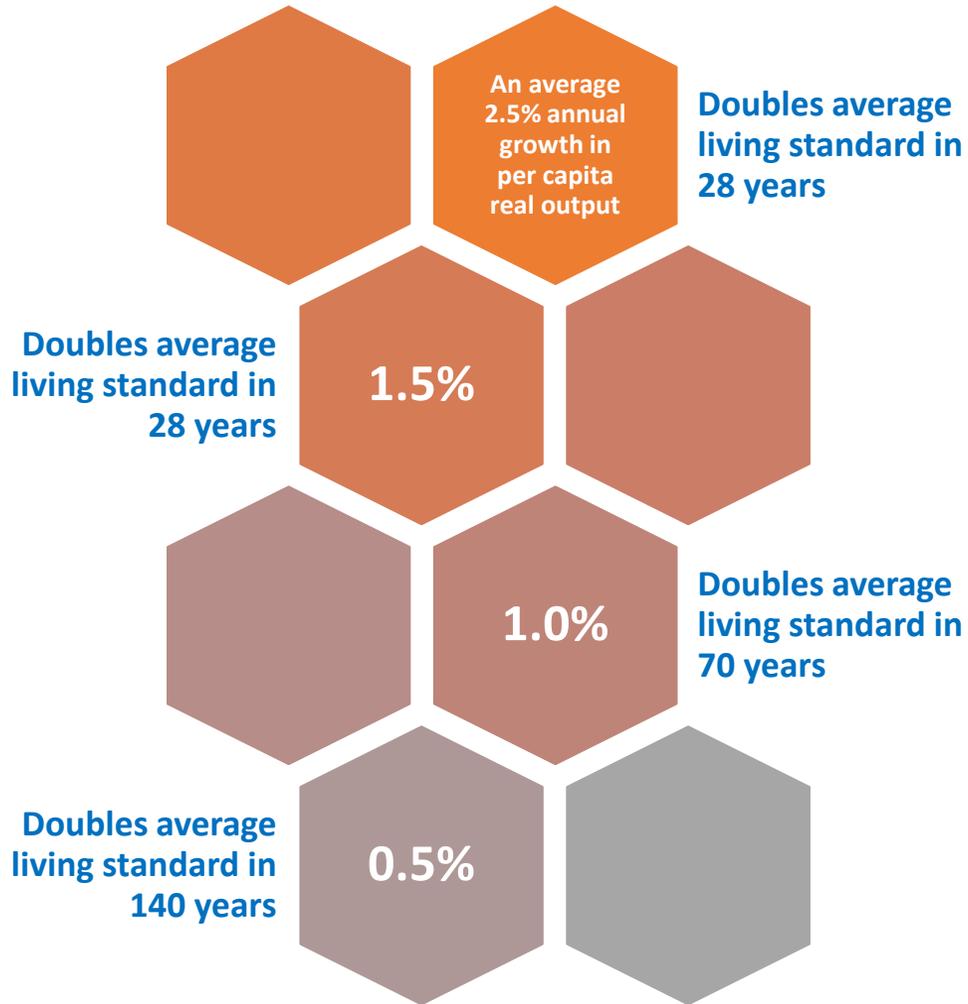

$$TFP = \frac{Y}{X}$$

$$\frac{d \ln(TFP)}{dt} = \frac{d \ln(Y)}{dt} - \frac{d \ln(X)}{dt}$$

Outline

- 1. Why do productivity growth and productivity matter?**
- 2. Some stylized facts and Technological Progress**
- 3. Adoption of farm technologies**
- 4. Reflections on Measurement, Agricultural Output and Productivity Growth**
- 5. Policy**

Why does productivity growth matter?

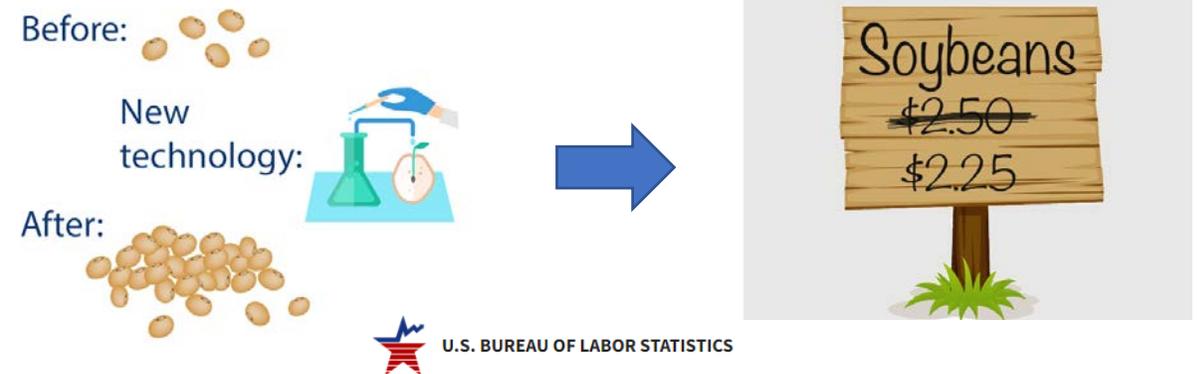

The Rule of 70:= 70/growth rate.

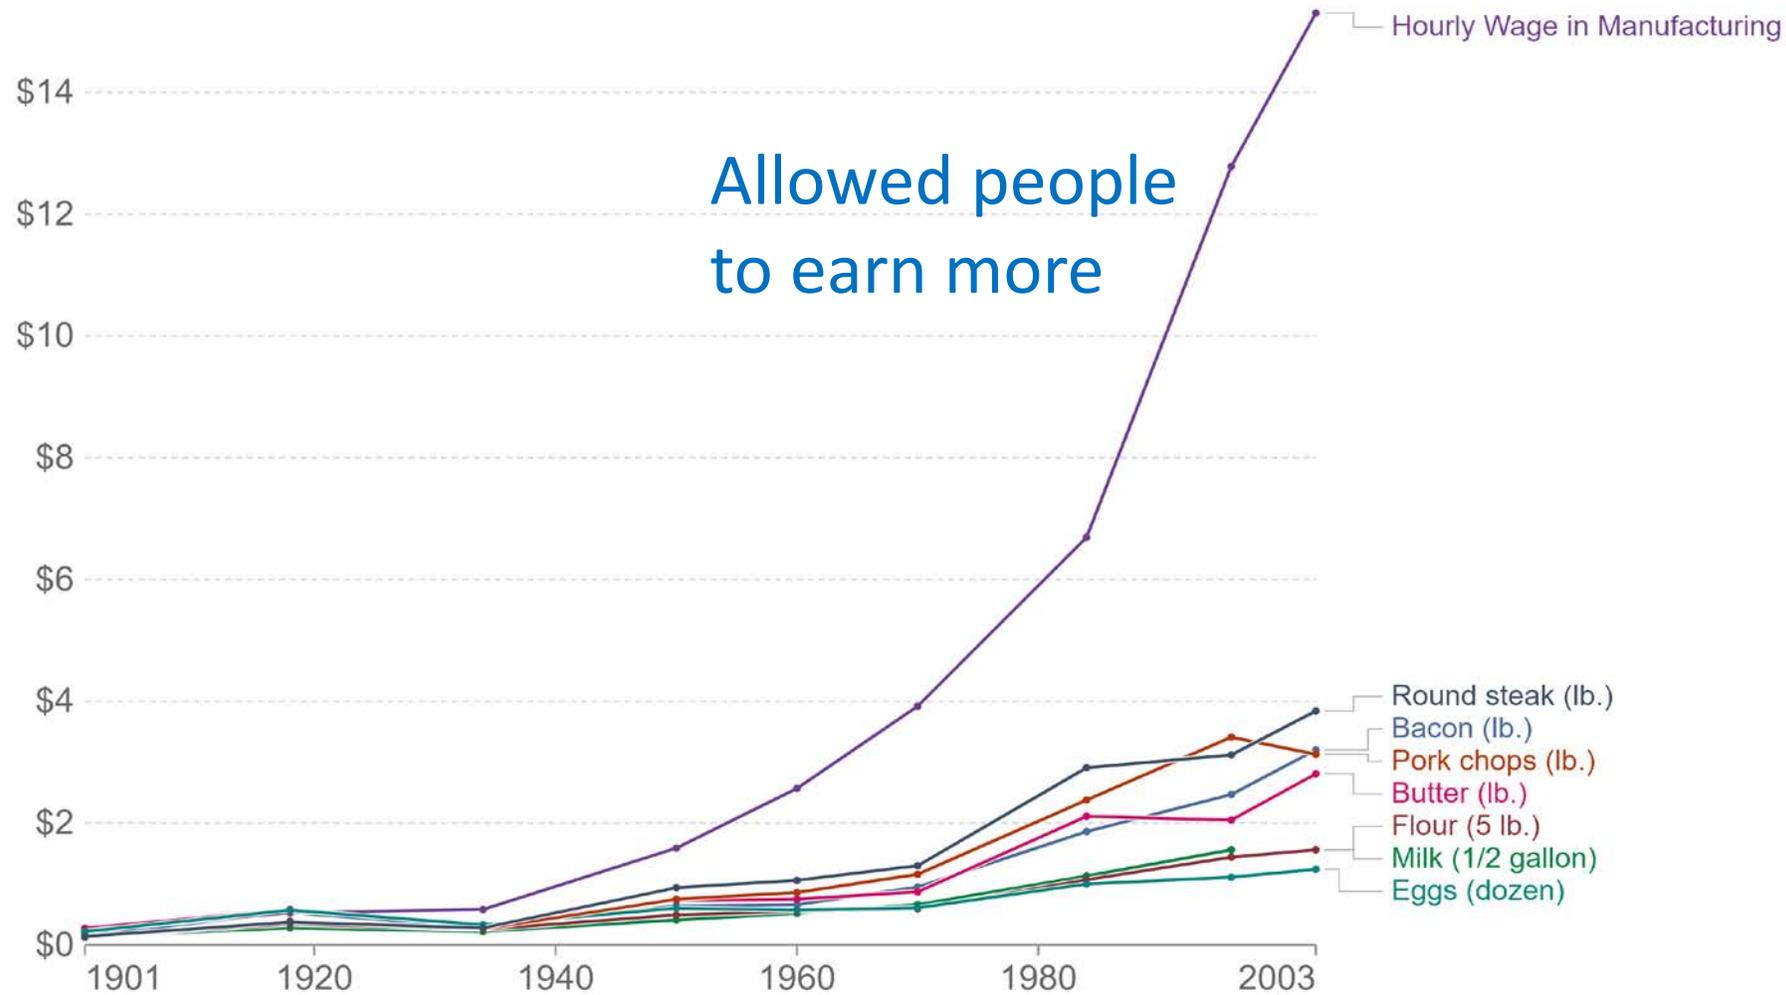

“Productivity isn’t everything, but, in the long run, it is almost everything.” — economist Paul Krugman

“Rising productivity is the key to making possible **permanent increases** in the standard of living.”

“Changes in technology are the only source of **permanent increases** in productivity.”

TRENDS IN FARM MANAGEMENT AND SCALE OF FARM OPERATION

Chairman: CLAUDE HUDSON, *Economics Division*

THE EFFECT OF TECHNOLOGICAL CHANGES ON FARM MANAGEMENT

LOWELL S. HARDIN¹

Increasingly the job of the farm manager is to try to keep abreast of the technological parade — a parade which no longer moves on foot but at times launches forward as if jet propelled. It is the purpose of this discussion, therefore, to analyze the implications of selected technological changes in progress today.

A prime goal of management is to make full and profitable use of existing and available resources. Just as soil, labor and the management ability of farmers are resources, so also are the technological developments available. Slowly, at times, but surely, man is adopting and using technical developments to broaden management's control over other resources. The facets of modern farm technology are varied yet so interrelated as constantly to add complexity to the management problem. A simple, short run input-output analysis may be grossly inadequate in deciding "will the change pay"? The full impact of changes may not be felt for five or ten years. Complementary relationships, if involved, may require several years for full expression. Adding to this complicating factor is the ever present dynamics of physical input-output and price relationships in the changing weather, biological and economic scene.

Because of joint relationships which are involved and because the

Available technological developments are resources

1950s: "Increasingly the job of the farm manager is to try to keep abreast of the technological parade — a parade which no longer moves on foot but at times launches forward as if jet propelled."

A simple, short-run input-output analysis may be grossly inadequate in deciding "**will the change pay**"?

- Complementary relationship between technologies
 - Mechanization
 - Storage technology (including feed)
 - Breeding, fertilization and crop management
 - Animal nutrition and mechanization (vs. hand feeding)
- Dynamics of physical input-output and price relationships
- **The changing weather, biological** and economic scenes.
- Unpredictability of the outcomes of certain technological developments.
 - $E[Q] \uparrow, E[\pi] \uparrow$ or \downarrow and depends on the elasticity of demand
- Adoption of innovation and creative destruction

TRENDS IN SCALE OF FARM OPERATION — WESTERN CANADA

GORDON HAASE¹

The more important changes in the farm business in Western Canada in recent years represent primarily changes in the relative proportions of the main factors used in agricultural production. The features of the farm business in Western Canada which have undergone significant alteration during the past twenty-five years or so may be summarized as follows:

1. Farms are becoming larger, and fewer in number while the farming area has grown only slowly;
2. Numbers of persons engaged in farming in the West are declining.
3. Amount of farm machinery in the region and the investment it represents, have increased markedly in recent years.

The nature and extent of these trends is illustrated by published

TABLE 1.— SIZE OF FARM, LABOR FORCE AND MECHANIZATION, PRAIRIE PROVINCES 1931-1951

| Year | Av. Improved Acres per Farm | Farm Labor Force (b) | Investment in Machines (c) |
|-----------|-----------------------------|----------------------|----------------------------|
| | acres | thousand | thousand dollars |
| 1931..... | 208 | 426 | \$ 356,658 |
| 1936..... | 202 | 456 (d) | 261,193 |
| 1941..... | 222 | 418 | 317,769 |
| 1946..... | 241 | 394 | 481,166 |
| 1951..... | 270 (e) | 369 | 1,147,448 |

(b) Dom. Bureau of Statistics Ref. Paper 23 and Quarterly Labor Force Surveys.

(c) Census of Canada and Prairie Provinces.

(d) Estimated as same proportion of Canada total as 1931 and 1941 i.e. 40 per cent.

(e) Estimated.

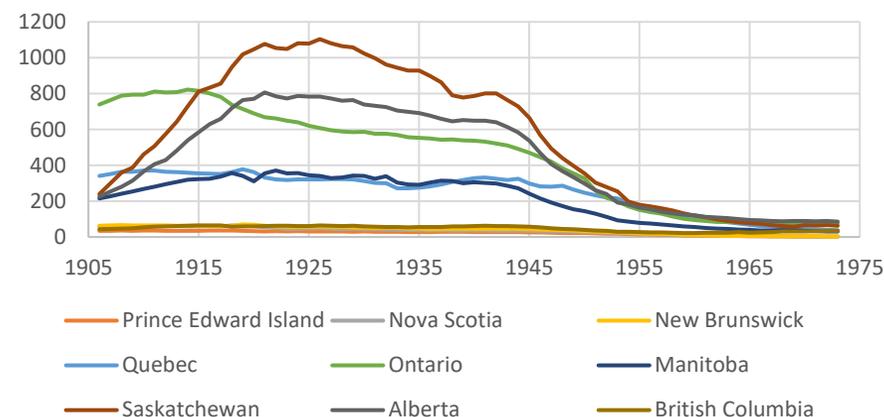

data relating to western Canadian agriculture. They indicate that farm size, labor supply and machinery complement are closely related in farming. An increase in the size of farm can ordinarily be achieved only by an increasing labor supply, or by using more and bigger machinery, or both these alternatives. Between 1931 and 1951, the average farm in the Prairie Provinces increased in size from 208 acres of improved land to about 270 acres per farm, (Table 1). However, the number of farm workers in prairie agriculture dropped by 57,000 in the same period, after increasing for a time during the back-to-the-land movement of the thirties. Increasing farm size and fewer farm

¹Economics Division, Canada Department of Agriculture, Edmonton, Alberta.

Substituting Horsepower for Horses

- “... changes in the relative proportions of the main factors used in agricultural production.”
- “Amount of farm machinery in the region and the investment it represents have increased markedly in recent years.”
- **Implications for those beginning farming**
- \$357 mil (1931) to 1,147 mil (1951)
- Each worker’s departure was accompanied by the introduction of about \$6,800 worth of machinery.

Technological progress and the number of horses on farms in Canada, x1000

TRENDS IN SCALE OF FARM OPERATIONS —
EASTERN CANADA

G. P. BOUCHER¹

The most significant developments in our Eastern agriculture in the war and post-war period are reflected in the increased productivity per worker. The number of agricultural workers has decreased but the volume of agricultural production has increased at a faster rate. Much of this success can be attributed to a high level of general economic development and prosperity and also to the use of new and better machinery, the adoption of better farming practices, more skilled workmanship and management, better financing facilities, the ability and willingness of the farmer to modify the structure of his farm business and his keen interest in the practical applications of experimental research. Technological developments have strengthened the farmer's command over resources and increased his ability to manage a larger business.

The farmer of Eastern Canada, however, does not usually find it easy to increase the size of his farm business by the acquisition of new land. Economies of scale are more easily realized by efforts to increase the capacity of the farm to make use of larger inputs of other factors of production or by the adoption of a more intensive type of production.

Intensification is likely to contribute to success but one must not overlook the fact that the diversified character of Eastern farming accentuates the co-ordination problem. Moreover, many of the smaller farms display little ability to take advantage of modern methods of farming and modern equipment, and to fully utilize all of their labour resources.

Increases in scale of operations, increases in machinery and various other sources of expenditures have all contributed to a pronounced increase in capital requirements. One can easily visualize the potential dangers of such a development in periods of economic instability. A particularly difficult situation is created for the young farmer with inadequate financial resources, planning the acquisition or establishment of an efficient farm.

Most of the foregoing observations are matters of common knowledge which can be supported by statistical evidence. Census figures, in fact, indicate that the total population of the five Eastern provinces has increased but that the farm population has decreased from 1931 to 1951. The decline in farm population was paralleled by a decline

¹Economics Division, Canada Department of Agriculture, Ottawa.

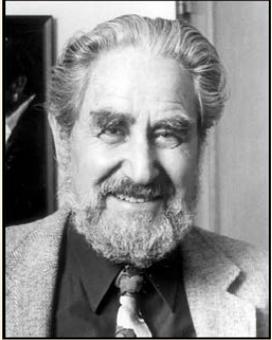

“Technological developments have strengthened the farmer’s command over resources and increased his ability to manage a large business.”

- High general economic development and prosperity
- More skilled workers and management
- **Adoption of more intensive types or production**
 - Fertilizer use: 239,062 tons (1941) – 595,292 tons (1951)
- Increases in farm mechanization
 - Tractors – 22,299(1931) -149,479 (1951)
 - Horse: 1,060,284 (1931)– 665,700 (1951)
- A pronounced increase in capital requirements.
- **Better financing facilities**
- **Farmers’ willingness and ability to adopt better farming practices (acceptance)**
- Farmers’ keen interest in the practical application of experimental research.
- **Smaller farms display little ability to take advantage of modern methods**

Takeaways ...

- Growth in the agri-food sector has been spurred by **technological and institutional innovations**.
- Increase output and reduced inputs – process innovation
 - advances in plant and animal breeding,
 - mechanization,
 - agricultural chemicals,
 - irrigation and others
- Importance of institutions (finance, research, etc.)
- The results of sustained investment in agri-food
 - Enabled the delivery of safe, cheap and plentiful food.

Measure what you treasure

Zvi Griliches

In his presidential address to the American Economic Association (1994) Griliches wrote: “The major message that I will be trying to convey is that we often misinterpret the available data because of inadequate attention to how they are produced and that the same inattention by us to the sources of our data helps to explain why progress is so slow. **It is not just the measurement of productivity that is affected.** Other fields of empirical economics are also struggling against limitations imposed by the available data. Great advances have been made in theory and in econometric techniques, but these will be wasted unless they are applied to the right data.”

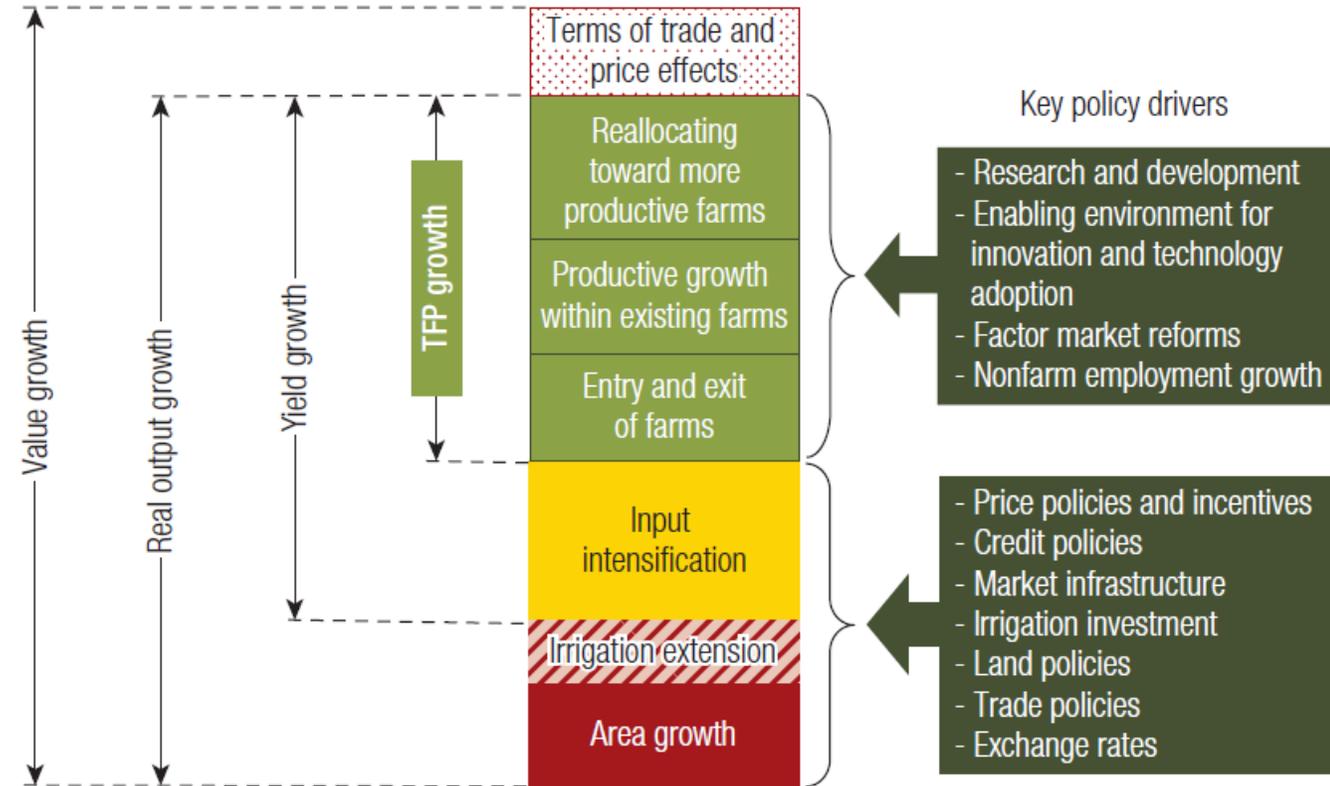

- **Issues**

- Quality of inputs and outputs, aggregation
- Introduction of new outputs over time
- Bias in price indices
- Measurement errors vary in importance over time

Sources Economic/Output Growth

What output growth drivers matter most?

- **Productivity-led:** Rate of growth of technological innovation (Uzawa 1965; Lucas 1988; Romer 1990; Grossman & Helpman 1992; Aghion & Howitt, 1992, 1998)
- **Resource-led:** Replication of existing technologies

Challenges and Opportunities

Path Forward

PRESIDENT'S ADDRESS,
AMERICAN FARM MANAGEMENT ASSOCIATION,
BALTIMORE, MD., JANUARY 8, 1919.

JOURNAL

FARM ECONOMICS

VOL. I. JUNE, 1919. NO. 1

G. A. BILLINGS,

OFFICE OF FARM MANAGEMENT.

The unusual demand for food products and the scarcity of farm labor since the war began have given rise to conditions which demand greater concentration of effort on farm management problems. These problems affect the community, the state and the country as a whole and are in a measure sociological; nevertheless, since they bear a close relation to production and to the individual farm, the basic unit of production, they are of vital importance to the economic management of the farm.

There has been no period in the history of this country when economic conditions have changed so rapidly, requiring the most careful thought concerning the organization of farms of different types to meet present day needs, and the changes which may take place after the war; the policy of price fixing of farm products and its bearing on profitable production as compared with the fundamental law of supply and demand; the mobilization of farm labor to produce the supply of food needed; and many other important questions. The cost of producing milk in large dairy regions and the cost of producing wheat as the basis for fixing the minimum price of wheat to the farmers, illustrate the kind of information which has more recently been demanded. The requests for such information point out conclusively that the results from the investigation of farm management problems by state and federal departments should be tabulated, summarized and held in readiness for such requests. Moreover, this information should be put into such shape that it may be given to the farmer by extension workers as suggestions for adjusting his system of farming to meet these changing conditions.

In normal times the ratio between food production and the increase in population is quite constant. Statistics show that during the last three decades there has been a slight increase per capita in the production of wheat and corn, due in part to the cultivation of more land, but also to more intensive methods of farming. Under such

In 1919, in his presidential address to the American Farm Management Association, Billings note: "There has been no period in the history of this country when economic conditions have changed so rapidly, requiring the most *careful thoughts* concerning *the organization of farms of different types* to meet present-day needs..."

- Unusual demand for farm products
- Scarcity of farm labour
- Need for and importance of data

Challenges:

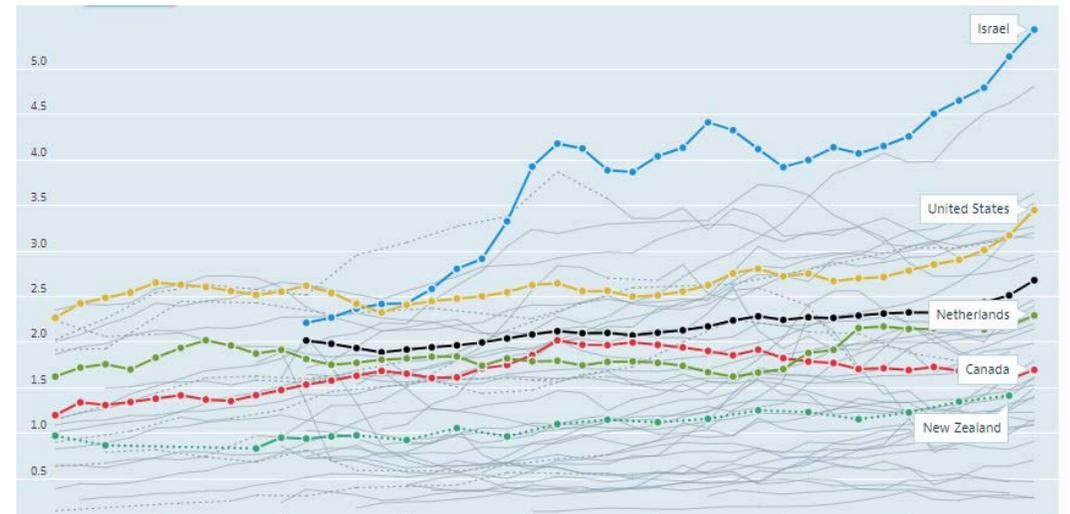

- Trade is the lifeline of Canada's agriculture
 - Economic issues related to increasing competition at the international level
- Supplies healthy and nutritious food at reasonable prices
- Climate change and volatile weather
 - heat and drought can negatively impact crops and livestock
- Farming produces greenhouse gases that contribute to climate change
- COVID-19, conflicts and supply chain disruptions
- Labour shortage, animal welfare/protection
- New production techniques will be required to enhance productivity and the importance of innovation is even greater

Opportunities:

- Growing global populations and rising income in developing and emerging economies
- Natural resources (water, ..)
- Continued application of advances in biotechnology.
- **Invention**
 - High level of education
 - Ranks among the top in public investment in R&D
 - Maintained significant investment in science
 - Many important technologies originate in Canada (agriculture, robotics, vaccination, etc.)

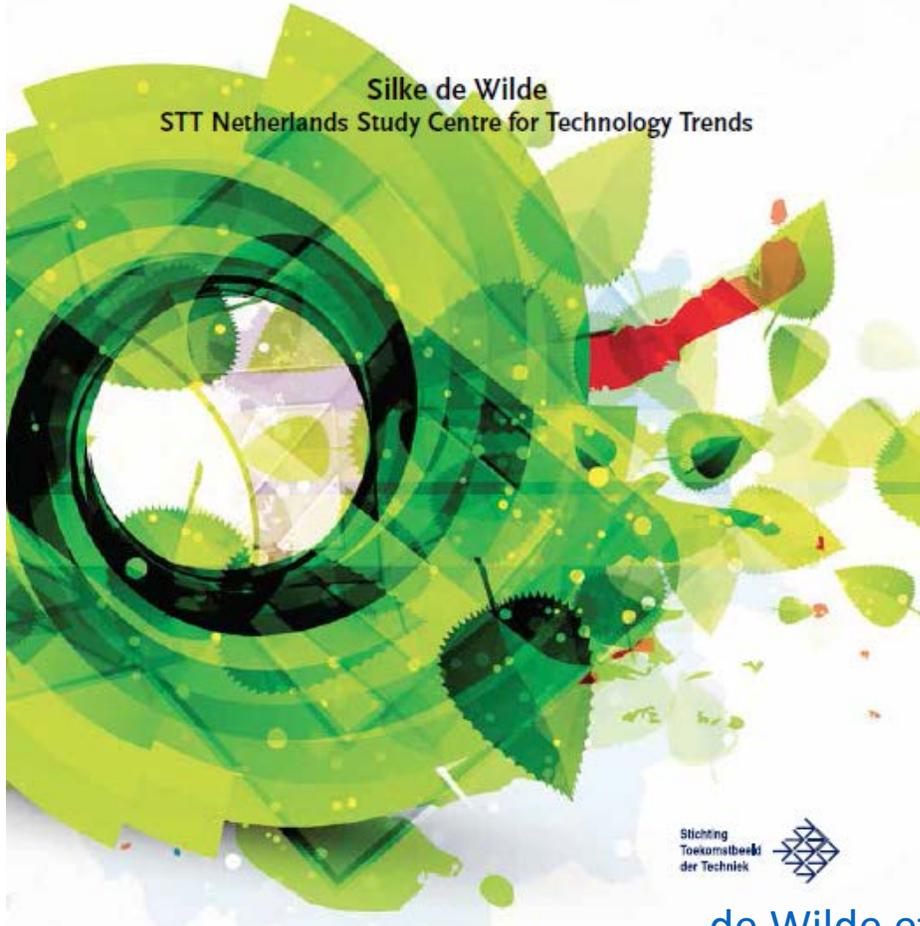

Innovation:

- One of the lowest performers in terms of private-business R&D expenditures.
- Confusion between invention & innovation (**Breznitz, 2021**).

- Growing Forward 2: (2013-2018)
 - Focus: innovation
 - Outcome: long-term profitability and competitiveness
- Canadian Agricultural Partnership (2018-2023)
 - Focus: science, research and innovation
 - Outcome: increase competitiveness, productivity, profitability

Importance of government support to innovation by source, (fiscal years 2016 to 2018) (%)

| Sources of support | High | Low | NA |
|----------------------------------|------|------|------|
| R&D tax incentives | 53.1 | 29.1 | 17.8 |
| Government R&D grants | 46.4 | 28.8 | 24.8 |
| Government financing support | 42.7 | 28.7 | 28.6 |
| Training and hiring programs | 35.4 | 34.4 | 30.2 |
| Government research facilities | 27.3 | 38.7 | 33.9 |
| Other government programs | 27.3 | 32.6 | 40.1 |
| Export development assistance | 26.3 | 32.9 | 40.8 |
| Government procurement | 12.3 | 39.8 | 47.9 |
| Incubator & accelerator programs | 12.1 | 38.5 | 49.4 |

Canada can play a major role in fighting global poverty and hunger

- **Slowdown productivity and the rise in inequalities are of major concern**
- Two-thirds of the world's extreme poor earn their livelihood from agriculture.
- Globally, between 720 and 811 million people faced hunger (UN 2020).
- Nearly one in three people do not have access to adequate & healthy food.
- Civil conflicts, climate change, climate variability and extremes, economic slowdowns and downturns, COVID-19, and the Russian-Ukraine war are the major drivers slowing down progress, particularly where inequality is high.
- Hence, an increase in agricultural productivity is key.

Canada's animal genetic exports (for breeding purpose)

Animal genetic exports in Canadian dollars

| | 2017 | 2018 | 2019 | 2020 | 2021 |
|--|--------------------|--------------------|--------------------|--------------------|-------------|
| Cattle embryos | 8,461,298 | 7,525,307 | 5,643,074 | 5,970,007 | 5,211,121 |
| Dairy semen | 126,677,022 | 119,144,908 | 108,782,087 | 109,639,454 | 103,380,070 |
| Dairy cattle | 13,801,880 | 11,498,035 | 14,805,437 | 12,230,237 | 13,064,418 |
| Beef cattle semen | 6,746,062 | 4,867,394 | 6,456,247 | 4,662,768 | 9,189,835 |
| Beef cattle | 9,039,177 | 8,455,064 | 7,680,724 | 7,927,214 | 7,191,563 |
| Swine | 45,053,279 | 41,224,383 | 44,803,423 | 61,852,366 | 50,851,624 |
| Purebred horses | 8,933,527 | 9,820,798 | 15,217,517 | 6,877,026 | 6,358,354 |
| Fowls, live domestic weighing not more than 185 g | 23,304,091 | 20,685,784 | 19,808,639 | 14,374,587 | 15,567,165 |
| Turkeys, live, weighing not more than 185 g | 32,724,700 | 36,043,627 | 29,744,191 | 25,993,030 | 28,840,141 |
| Ducks, geese and guinea fowls, domestic, live, weighing not more than 185 g | 5,330,858 | 3,782,536 | 4,041,082 | 2,221,691 | 2,375,197 |
| Hatching eggs | 68,848,918 | 65,022,266 | 71,502,560 | 66,026,944 | 74,395,392 |
| Total exports | 349,284,029 | 328,464,858 | 328,607,264 | 319,444,336 | |

Summary

- **Technological change** key to the agri-food sector.
- The challenges posed by the global food supply will continue to push the agri-food sector towards technological innovation.
- Much to be gained from data availability and accessibility:
 - Importance of collaboration in the production of data for research and access.
 - Efforts to measure business-level production practices.
- What is the effect of demand on measured productivity at the firm level?
- The role of intangible capital?
- What/Which productivity drivers matter most and in what agri-food sub-sector?
- What is the role of public policies that boost productivity growth (e.g., market regulation design)?
- Delighted to see what the next decades bring in technological progress and productivity research given the speed of technological advances.

Thank you!
